

## Efficiency Of Wireless Networks Approximation Algorithms For The Physical Interference Model Foundations And Trends In Networking

Thank you very much for reading **efficiency of wireless networks approximation algorithms for the physical interference model foundations and trends in networking**. As you may know, people have looked numerous times for their chosen readings like this efficiency of wireless networks approximation algorithms for the physical interference model foundations and trends in networking, but end up in infectious downloads.

Rather than enjoying a good book with a cup of tea in the afternoon, instead they cope with some harmful bugs inside their laptop.

efficiency of wireless networks approximation algorithms for the physical interference model foundations and trends in networking is available in our digital library an online access to it is set as public so you can download it instantly.

Our book servers saves in multiple locations, allowing you to get the most less latency time to download any of our books like this one.

Merely said, the efficiency of wireless networks approximation algorithms for the physical interference model foundations and trends in networking is universally compatible with any devices to read

---

Efficiency of Wireless Networks: Approximation Algorithms ...

Assuming that the deployment of one sensor has one unit cost, we define utilization efficiency as network lifetime  $L$  divided by the number of deployed sensors  $N$ , i.e., (5)  $\eta = L/N$ . Utilization efficiency indicates the rate at which network lifetime  $L$  increases with the network size  $N$ . It captures the tradeoff between network lifetime and deployment cost.

Abstract: Wireless sensor networks (WSNs) have been widely used in a plenty of applications. To achieve higher efficiency for data collection, WSNs are often partitioned into several disjointed clusters, each with a representative cluster head in charge of the data gathering and routing process. Such a partition is balanced and effective, if the distance between each node and its cluster head can be bounded within a constant number of hops, and any two cluster heads are connected.
