The term " bond spreads " or " spreads " refers to the interest rate differential between two bonds. Mathematically, a bond spread is the simple subtraction of one bond yield from another. Bond spreads are the common way that market participants compare the value of one bond to another, much like " price-earnings ratios " are used for equities.

What Are Bond Spreads?

Interest rate risk: When interest rates rise, the market value of fixed income securities (such as bonds) declines. Similarly, when interest rates decline, the market value of fixed income securities increases. Interest Rates: The percentage paid as a fee for the use of money, expressed as an annual percentage of the principal amount. Interest rates are influenced by a variety of factors, including economic growth, inflation and supply/demand.

Understanding Interest Rate Swaps | PIMCO

In lending, the spread can also refer to the price a borrower pays above a benchmark yield to get a loan. If the prime interest rate is 3%, for example and a borrower gets a mortgage charging a 5%...

General financial market conditions, as market participants not having as many resources to lend will affect prices of all types of bonds Rather than looking at yields, analysts typically look at credit or bond spreads, or the difference between a corporate bond ' s yield and a benchmark interest rate on government securities.

COVID-19, Monetary Policy and the Corporate Bond Market ...

When spread betting interest rates, the contract is priced at 100 minus the interest rate. If the interest rate is at 2.5%, the market will be priced at 97.5. At first it can seem quite counter-intuitive, as if you think interest rates will rise you will need to place a sell spread bet, if you think they will fall you will place a buy spread bet.
