An FPGA allows you to design digital circuits. Digital circuits are basically just a bunch of logic gates (and, or, nor, etc.) connected together to perform a specific task. The designs that you create can range from something as simple as a counter that blinks an LED to something as complex as a multicore processor.

Maybe a better question is, "Should I choose to use a microprocessor or create a custom digital circuit design with an FPGA device? Programming languages like Arduino or Python are used a lot, and resources are easy to find and understand. The same isn't quite true for how to create designs for FPGAs.
