The inductance of a moving iron ammeter with a full scale deflection of 900 at 1.5A, is given by the expression $L = 200 + 40 \theta^2 \mu\text{H}$, where θ is deflection in radian from the zero position. Estimate the angular deflection of the pointer for a current of 1.0A. Solution: $L = 200 + 40 \theta^2 \mu\text{H}$.

This chapter explains three principles and units of electronic measurements: (1) the MKS. system, (2) the SI system, and (3) absolute measurements. The MKS system was defined by Giorgi, who stated that if the units of mass, length, and time were taken as the kilogram, meter, and second, respectively, and one electrical unit (the ampere) added, then a completely self-consistent system of units could be devised such that the fundamental electrical units were the same as the practical ones.
