Synopsis. An explanation of how a new view on the regulation of metabolism has been opened by the theory of metabolic control analysis. It brings together a full explanation of the new theory with an account of its experimental implementation since its origins in the 1970s. As well as noting the differences between metabolic control analysis and traditional metabolic biochemistry, the books describes the background of enzyme kinetics and metabolic investigations on which this new theory draws.

A very well understood example of extrinsic control is the regulation of glucose metabolism by the hormone insulin. Insulin is produced in response to rises in blood glucose levels . Binding of the hormone to insulin receptors on cells then activates a cascade of protein kinases that cause the cells to take up glucose and convert it into storage molecules such as fatty acids and glycogen . Our metabolism is complex – put simply it has two parts, which are carefully regulated by the body to make sure they remain in balance. They are: Catabolism – the breakdown of food components (such as carbohydrates , proteins and dietary fats ) into their simpler forms, which can then be used to provide energy and the basic building blocks needed for growth and repair.
